Summary

- Emerging market risk continued to rise in June, although increases in our EWS scores were on average smaller than in the previous month. The overall EM risk index (Bloomberg: CEWSEM Index, Reuters: CEWSEM) rose from 42.75% to 44.16%, the highest reading since January 2011.

- Countries that already had above-average risk scores in May saw consistent further increases in June, with Turkey maintaining its position as the riskiest economy. The rise in Turkey’s EWS index was driven by a broad combination of a further deterioration in external balances, slower than expected industrial production and export growth, wider CDS spread, higher FX volatility and increased banking sector leverage.

- Lower growth and worse external balances also lifted the risk indices for Romania and South Africa, which joined Turkey at the top of the risk scale. In case of Romania, the increase in risk was further aggravated by an accelerating speed of real exchange rate appreciation. Strong REERs also supported the risk indices of Poland, Hungary, Czech Republic, Brazil and Mexico.

- Despite the appreciation of the REER, Mexico’s risk index nevertheless declined on the back of re-acceleration in May export growth and lower rate of money supply expansion. In addition, the risk indices for Singapore, Israel, Russia, Philippines and Argentina also declined. China maintained its position as the economy with the lowest currency risk.

- Due to high and rising risk indices, the EWS continues to issue hedge signals for long TRY, RON, ZAR, COP, PLN and BRL exposures (reduced hedge signals for short exposures). The model also issues new signals for the HUF and KRW, where lower external balances and exports led to increased risk.

- On the other hand, the above-average risk score for Mexico declined, pointing to no need to further deviate from the hedge benchmark.

** - The EWS risk indices are calculated as average rolling percent ranks of 12 indicators of economic and financial stress. The indices vary between 0% (low risk) and 100% (high risk). For more information, see slides 7-9.

** - Hedge signals are triggered for above average and rising risk indices. For investors with long emerging market currency exposures the delta of the hedge signal increases with the level of the risk index. For investors with short emerging market currency exposures, the delta of the hedge signals falls with the level of the risk index. For more information, see slide 5.
**EWS Risk Index Changes and Levels**

**Low but rising risk indices.**
No hedge required, but watch for signs of increased risk.

**High and rising risk indices.**
Consider hedging these currencies.

**Low and falling risk indices.**
No hedge is required. These currencies are ‘safest’.

**High but falling risk indices.**
Risk is receding. No hedge required, but watch for signs of increased risk.

*Citi; 30 June 2011*
**EWS hedge rule for EM exposures**

- Above average and rising risk indices are negative for EM currencies and justify putting on hedges for long EM exposures. Similarly, high and rising risk indices can be used as signals to reduce hedges on short EM exposures.

- The inception deltas of hedges are tied to level of EM risk:

  **EWS Risk Index**
  - **No Hedge**
  - **25 Delta Put on EM**
  - **ATMF Put on EM**
  - **Short EM via Forward**

  **EWS hedge decision rule for long EM exposures**
  - If Risk Index is unchanged or lower than in previous month
  - Any Risk Index Level
  - No Hedge

  **EWS hedge decision rule for short EM exposures**
  - If Risk Index is higher than in previous month
  - Risk index is below 50%
  - Risk index is between 50-55%
  - Risk index is between 55-65%
  - Risk index is above 65%

  - Long EM via Forward
  - ATMF Call on EM
  - 25 Delta Call on EM

- **EWS risk indices vs 3M ann. cost of USD carry**

  - If the annual carry in the hedge is more than -10% (i.e. the annualised cost of hedging EM exposures is more), then increase the thresholds for each hedge trigger by 1 percentage point that the cost of carry exceeds -10%.
Appendix
Introduction to the EWS
Model Parameters

- The EWS is a set of indices that measure economic and financial stress in 22 emerging market economies:
  - The risk indices use 12 inputs that have historically been good predictors of currency weakness.

- The risk indices are calculated as percent ranks*, normalising each country’s inputs onto a common scale. The percent rank measures stress on a relative scale: for a variable to indicate high stress, it needs to deteriorate relative to its own history, as well as other economies.

- The EWS risk indices vary between 0% (low stress) and 100% (high stress):
  - The theoretical mean of the percent rank is 50%. Risk indices above this level indicate above average stress;
  - Due to the large number of inputs, extreme values of the indices have been rare. Most risk indices have historically fallen between 25% and 75%.

- The same 12 inputs are used for all 22 economies, if available. The inputs are weighted equally.

- The same methodology is used across all economies, making the indices comparable to each other.

- We have combined the levels and changes in the risk indices with the cost of carry to provide a transparent, rules-based framework for determining optimal EM currency hedges.

* Percent rank shows the rank of a value in a data set as a percentage of the data set. The percent rank of the minimum is 0%, median is 50% and maximum is 100%.
EWS Economic Indicators

**Direction of stress**

**External financing need or surplus.** We use the sum of the current account balance and net foreign direct investment flows, normalised by GDP, as an indication of the external financing need. If local economic conditions deteriorate or global risk aversion rises, foreign investor may be less willing to finance the external deficit, leading to currency weakness;

**Money supply.** Increased supply of the currency may lead to a weaker exchange rate. Fast money growth is particularly risky if the central bank’s reserves are low or falling, reducing its ability to manage the potential weakening of the currency;

**Industrial production.** Low or falling industrial production growth is a sign of economic weakness, which may require a weaker currency to revive demand;

**Exports.** Low or falling export growth indicates either reduced competitiveness or lower foreign demand. Currency weakness may be required to restore demand for exports;

**Loan-to-deposit ratio of the financial sector.** This variable indicates how much of the assets of the financial sector are covered by the more ‘safe’ deposit financing. A highly leveraged financial sector is a risk to the economy and currency;

**Short-term debt.** Short-term foreign liabilities of the financial sector (we use consolidated liabilities to BIS banks), normalised by the value of FX reserves, is a source of risk if local or global economic conditions deteriorate.
EWS Financial Indicators

Direction of stress

**Implied currency volatility.** The volatility implied by currency options prices is a measure of market’s expectation of future exchange rate uncertainty. Periods of high implied volatility have historically been consistent with weak EM currencies;

**CDS spread.** The CDS spread measures the market’s perception of sovereign default risk. High risk of default discourages foreign investment and demand for local currency;

**Equity prices.** Poor performance of the local equity market indicates deteriorating outlook for corporate earnings and weaker economic conditions, which may require a lower exchange rate to restore profitability. Weak equities also discourage foreign investment flows;

**Economic surprises.** Worse than expected data releases may deter foreign investors, lead to financial outflows or indicate a cyclical downturn, all of which may weigh on the currency. We use the Citi Economic Surprise Indices to measure aggregate data surprises;

**Global risk.** A rise in global risk aversion typically leads to increased home bias and outflows from risky emerging market economies. Countries that have been the biggest recipients of short term foreign inflows, are most at risk. We use the Citi long-term Macro Risk Index to measure global risk aversion and combine it with data on balance of payments portfolio liabilities, normalised by FX reserves. The importance of portfolio flows in indicating stress is a positive function of the risk aversion indicator;

**Real Effective Exchange Rate.** Real appreciation (higher relative inflation and/or stronger exchange rate) relative to the main trading partners reduces competitiveness and may require a weaker nominal currency going forward.

IMPORTANT NOTICE

This presentation has been prepared by individual sales and/or trading personnel of Citigroup Global Markets Limited and/or its subsidiaries or affiliates (collectively "Citi") and not by Citi’s research department. It is not investment research or a research recommendation for the purposes of FSA rules, as it does not constitute substantive research or analysis.

The provision of information is not based on your individual circumstances and should not be relied upon as an assessment of suitability for you of a particular product or transaction. Even if we possess information as to your objectives in relation to any transaction, series of transactions or trading strategy, this will not be deemed sufficient for any assessment of suitability for you of any transaction, series of transactions or trading strategy.

This presentation is provided for information purposes and is intended for your use only. Save in those jurisdictions where it is impermissible to make such a statement, we hereby inform you that this presentation should not be considered as a solicitation or offer to sell or purchase any securities. This presentation does not constitute investment advice and Citi makes no recommendation as to the suitability of any of the products or transactions mentioned. Any trading or investment decisions you take are in reliance on your own analysis and judgment and/or that of your advisors and not in reliance on us.

This presentation is not intended to forecast or predict future events. Past performance is not a guarantee or indication of future results. Any estimates and opinions included herein constitute Citi’s judgment as of the date hereof and are subject to change without any notice.

Any products or securities described herein may be subject to fluctuations of their mark-to-market price or value. Such fluctuations may, depending on the type of product or security and the financial environment, be substantial. In addition the securities described herein may provide for payments linked to or derived from prices or yields of one or more securities or other instruments or foreign currencies, and such provisions may result in negative fluctuations in the value of and the amounts payable with respect to such securities prior to or at redemption. You should consider the implication of such fluctuation with your independent accounting, tax and risk advisors.

This presentation may contain “forward-looking” information. Such information may include, but not limited to, projections, forecasts or estimates of cashflows, yields or return, scenario analyses and proposed or expected portfolio composition. Any forward-looking information is based upon certain assumptions about future events or conditions and is intended only to illustrate hypothetical results under those assumptions (not all of which are specified herein or can be ascertained at this time). It does not represent actual termination or unwind prices that may be available to you. Actual events or conditions are unlikely to be consistent with, and may differ significantly from, those assumed. Illustrative performance results may be based on mathematical models that calculate those results by using inputs that are based on assumptions about a variety of future conditions and events and not all relevant events or conditions may have been considered in developing such assumptions. Accordingly, actual results may vary and the variations may be substantial. The products or securities identified in any of the illustrative calculations presented herein may therefore not perform as described and actual performance may differ, and may differ substantially, from those illustrated in this material. When evaluating any forward looking information you should understand the assumptions used and, together with your independent advisors, consider whether they are appropriate for your purposes.

Certain transactions, including those involving swaps and options, give rise to substantial risk and are not suitable for all investors. Citi is not acting as your advisor, fiduciary or agent and is not managing your account. Citi does not provide investment, accounting, tax, financial or legal advice; however, you should be aware that any proposed indicative transaction could have accounting, tax, legal or other implications that should be discussed with your independent advisors. Therefore, prior to entering into any transaction, you should determine, without reliance on Citi, the economic risks or merits, as well as the legal, tax and accounting characteristics and consequences of the transaction and that you are able to assume these risks.

Citi shall have no liability to the user or to third parties, for the quality, accuracy, timeliness, continued availability or completeness of the data nor for any special, direct, indirect, incidental or consequential loss or damage which may be experienced because of the use of the information in this presentation or otherwise arising in connection with this presentation, provided that this exclusion of liability shall not exclude or limit any liability under any law or regulation applicable to Citi that may not be excluded or restricted.
